Channel Partner Instructions: Marketing Page

Important Note:

After February 14, 2025, please fully remove any previous HTML content to ensure that pages prior to this date are not merged with the new content.

Version 1.1

Module Installation

- For installation, you will need an html editor.
- It is recommended you have some knowledge of HTML to install this module.
- All styles have been wrapped in a `.channel-html` selector. This will automatically prevent any conflicts with existing CSS on your site.

Module installation components

- HEAD - CSS
- BODY - Markup
- FLEX Modules

Step 1 - HEAD - CSS

1. CSS exist within a single `<style>` tag inside of `<head>`
2. All styles have been wrapped in a `.channel-html` selector. This will automatically prevent any conflicts with existing CSS on your site.

Step 2 - BODY - Markup

1. You should still have the modules `index.html` open in your html editor.
2. In `index.html` find the `<channel-html>` node (it is the **only** HTML node in the `<body>`)
3. Copy all the content inside of `<channel-html>`.
4. In your own webpage, find a target element/container which will hold our module.
5. Place the copied markup within this target element.

Step 3 - FLEX Modules

- Flex Modules are modules which can be excluded from your page, if for example an accessory is not available in your GEO or storefront
- To remove them, locate the relevant comment for the feature such as:
  - `<!-- BEGIN > FLEX - $FEATURE -->`
  - `<!-- END > FLEX - $FEATURE -->`
- Remove the content between the comments

Step 4 - Images

If the supplied folders of `/images/` can be copied to your system, and remain in the same directory as your `index.html` file, then they should all appear on the page.

If not, or if they cannot be hosted here, then you can alter image file paths in step 2.

Step 5 - Scripts

In an effort to keep the HTML file size of our deliverable down, we have opted to split all of the necessary scripts for this experience into a separate file.

You'll find all of the necessary JavaScript files for this experience in the accompanying `./scripts` directory. You will need to host these files on your server and update any script paths accordingly at the bottom of the HTML body, as

referred to in step 2. For simplicity, you will find these scripts within `<!--BEGIN > CHANNEL SCRIPTS -->` and `<!--END > CHANNEL SCRIPTS -->` comments.

At this point the page should be ready to preview.

Step 6 - Customisation

Links:

- There are links within the module that should point to specific places in your website. We have built these with a placeholder URL: `<!--BEGIN PARTNER BUTTON-->`, all instances of this should be replaced with a working link before the module is live.

Styling:

- Make any image path updates in `<style>`, be careful not to modify anything other than the image paths
- Please do not alter the css in style, other than to update image paths: `<style>`.
- Make any other styling changes in `/styles/overview.built.css`.

Content:

- If needed, you can edit the markup (copied in step 2) directly.

Module Features

- Responsive design with support for large, medium and small viewports.
- Standard and high resolution images.
- Locally hosted images.

Viewport Definitions

The responsive design adapts to different screen sizes based on the following viewport ranges:

Viewport	Minimum	Maximum
small	320px	734px
medium	735px	1068px
large	1069px	∞

Minimum Width Requirements & Preventing Clipping

Global Minimum Width: 320px

The exported HTML content has a global minimum width of 320px. This is the standard minimum width for mobile phone displays.

Recommended Minimum Width: 380px

While the technical minimum is 320px, we recommend a minimum container width of **380px** to account for extra padding and prevent layout issues across different designs.

Component-Specific Constraints:

1. **Horizontal Scroll Cards**: Default to 320px width for small viewport
2. **Gallery Components**: Use `min-width: fit-content` which means they will expand to fit their content and may clip if the container is narrower than the content
3. **Components with horizontal scrolling**: Handle overflow with scrolling behavior, but very narrow containers may cause layout issues with navigation controls and padding

Important Implementation Guidelines:

- The exported HTML must be embedded in containers with a minimum width of **320px** for proper display
- **Recommended:** Use a minimum container width of **380px** to account for extra padding on different designs
- For optimal results without clipping, containers should be at least as wide as the viewport breakpoints listed above
- Very narrow containers (below 320px) will cause clipping issues with navigation controls, padding, and component layout
- Gallery or horizontal scroll components with content items wider than the container may experience visual issues

Recommendation: Ensure your target container element has sufficient width to accommodate the content at each viewport size to prevent clipping and maintain proper layout.

Convert Compare

In order to convert the compare from static or to static please follow the following steps

1. Open the expanded (unzipped) folder.
2. In your HTML editor open the source code file named index.html
3. Determine which compare you would like:
    - If static is required follow the following steps:
        1. Find this line

            ```
            <div id="interactive-compare-header" role="row" class="compare-row" compare-header-
            show="true">
            ```

            Change it to

            ```
            <div id="interactive-compare-header" role="row" class="compare-row" compare-header-
            hide="true">
            ```

        2. Find this line

            ```
            <div id="static-compare-header" role="row" class="compare-row" data-column-group="true"
            compare-header-hide="true">
            ```

            Change it to

            ```
            <div id="static-compare-header" role="row" class="compare-row" data-column-group="true"
            compare-header-show="true">
            ```

    - If interactive is required follow the previous steps in reverse.
