Channel HTML - Extract Inline Styles and Scripts from an HTML File

This guide will help you extract the inline styles and scripts from an HTML file.

Step 1 - HEAD - CSS

1. Save the content of the `<style>` block `<!--BEGIN > CHANNEL STYLES -->` and `<!--END > CHANNEL STYLES -->`.
2. Paste the content into a new file.
3. Save the file with a `.css` extension. (e.g. `channel-html.css`)
4. Update the HTML to reference the new file via a `<link>` in the `<head>`.

For example:

```
<link rel="stylesheet" href="styles/channel-html.css">
```

6. Update image url references in the css to be relative to the new file.

Step 2 - BODY - Scripts

1. Save the content of the `<script>` block `<!--BEGIN > CHANNEL SCRIPTS -->` and `<!--END > CHANNEL SCRIPTS -->`.
2. Paste the content into a new file.
3. Save the file with a `.js` extension. (e.g. `channel-html.js`)
4. Update the HTML to reference the new file via a `<script>` in the `<body>`.

For example:

```
<script src="scripts/channel-html.js"></script>
```

At this point the page should be ready to preview.
